

C2 Lumo Manager

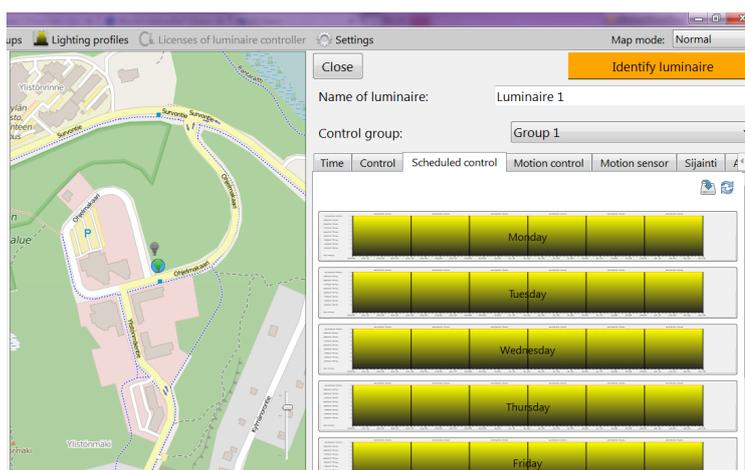

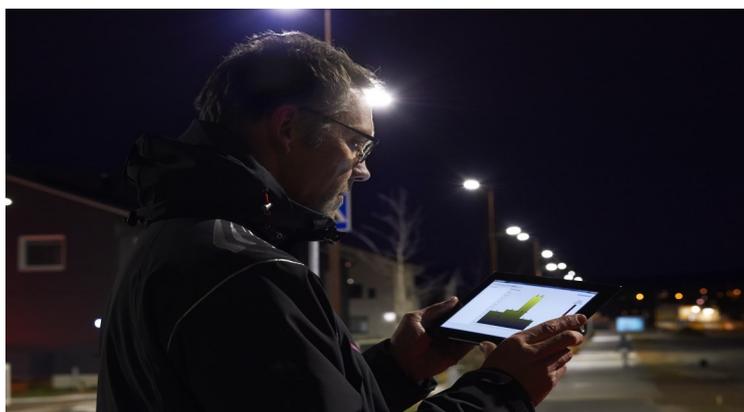

Application for wireless control of lighting

C2 Lumo Manager is an user-friendly application for easy control of lighting in a local network without extra data communication costs. The application features a wide range of control parameters to optimize the lighting in a given environment.

C2 Lumo Manager is installed on a personal laptop and thus accessible anytime. The application enables designing of weekly lighting schedules for a specific luminaire or a group of luminaires. The configuration is sent to the luminaires with a push of a button.

When the configuration is done, the lighting network operates stand-alone.

With the help of C2 Lumo Manager you can reduce the energy consumption of lighting, and ensure its operation at desired place and at desired time.

Smart wireless lighting control

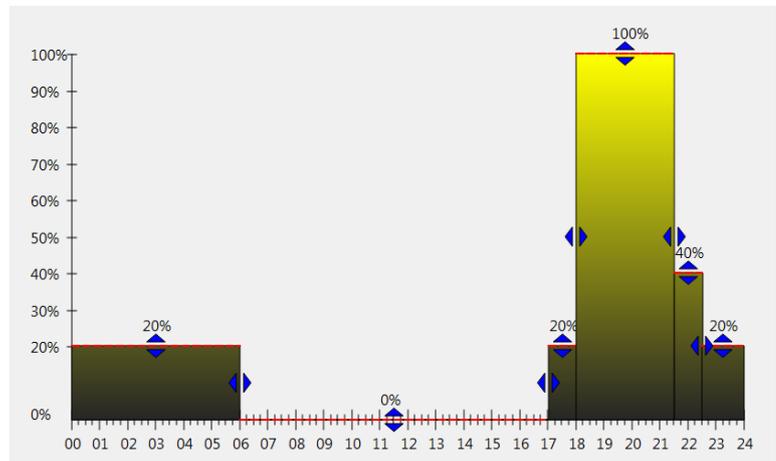

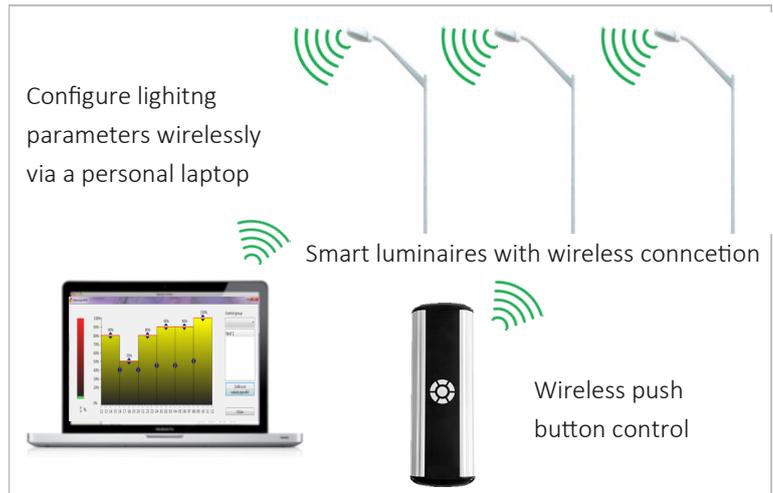

- Predefined parameters of the smart LED luminaires can be easily updated via laptop.
- The LED luminaires and the Lumo Manager communicate wirelessly via radio frequency.
- No extra data communication or operating costs.
- Grouping and regrouping luminaires with supportive equipment such as motion sensors and push-buttons.
- Significant savings in maintenance and energy costs

Stand-alone network

C2 SmartLumo controllers, installed inside the luminaires or in the light poles, operate according to the lighting schedules predefined with the C2 Lumo Manager application. The application allows, for example, the optimization of the light levels after the luminaire installation, and different kinds of options for using e.g. motion sensors or push buttons to trigger the lighting.

Example

An example of a lighting schedule for a playground is shown on the graph. At dusk, the luminaires are switched on at 20% light level and then brightened up to 100% when the button is pushed. The lighting can stay at full output or be dimmed in several steps down to the initial 20% light output. Dimming saves energy and increases the lifespan of the LED luminaires.
